MILANO

TECH TO WEAR

All our products are made with Whitek™, a synthetic material that arises from the need to take advantage of the high characteristics of Tyvek® to enhance the best quality, with treatments specifically designed to make Whitek™ a real fabric applicable to different sectors.

Dupont Tyvek® is a material made of pure polyethylene fibres randomly arranged and welded to form a support with interesting technical characteristics.

MADE IN ITALY

Bjanko has identified a process that through special pigments and dedicated machinery, allows to realize all the ranges of colors, solid color prints and patterns. The production is entirely made in Italy and is internal to the structure thanks to the support of craftsman.

SUMMER - SPRING

The applications of the fabric Whitek™ are endless, from clothing to footwear, but also bags, belts and hats. The collections are both summer and winter and dress everyone: woman, man, junior and kids. The summer collection includes the use of Whitek™ without further applications.

All the jackets of our summer collection and our bags, are presented within practical bags always made of Whitek™, which can be used both to store the jacket when you wear it and as a practical item holder.

WINTER- FALL

The applications of the winter collection men, women and children are many, Whitek™ in fact is coupled with faux fur or quilted of different shades and colors so as to make the fabric even warmer.

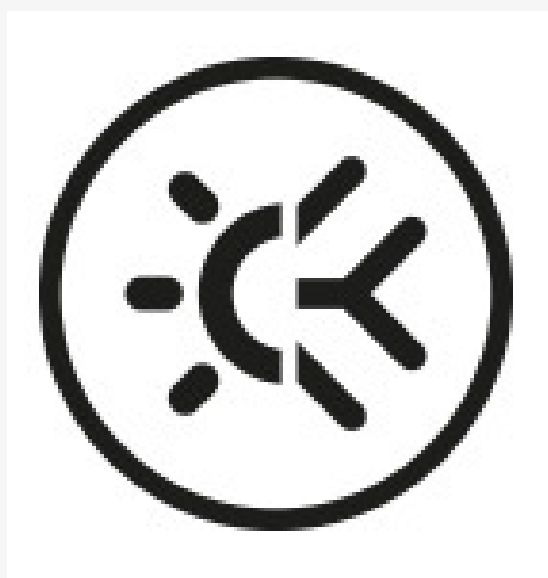

FASHION AND TECHNOLOGY

The research that Bjanko has conducted over the years leads to obtain a fabric that combines the technical characteristics of Tyvek® to a visual and tactile appearance suitable for Fashion and design products.

RECYCLABLE TECHNOFIBRE

The qualities of Tyvek® are in fact countless: ultra-light, breathable, waterproof, wind-proof, hypoallergenic, antibacterial, thermal insulation, tear-resistant, resistant to UV rays but also to chemicals but above all it is entirely recyclable.

The incredible technical characteristics of Whitek™ make the garments extremely versatile and suitable for everyday life, leisure and sport.

The classic and elegant lines make it suitable for all occasions.

The line in fact presents garments with or without hood, drawstrings around the wrists and waist, externally applied pockets that can be folded with zip or rows.

In practice, Tyvek® is made with high density pure polyethylene fibres, randomly arranged and welded to form a particularly resistant fabric that is even counted in the category of techno fibres. The research that Bjanko has conducted over the years puts great emphasis on colors, printing and dyeing techniques of this fiber that seems refractory to accommodate the normal procedures on the market and does not tolerate temperatures above 80% typical of almost all traditional printing and dyeing processes.

The fabrics made on natural Tyvek® are dusty, attractive and light, almost with a cloud effect, characteristics that give the product a unique feature. Bjanko did not stop and went on with the research, surpassing the traditional colors, applying to the fabric special membranes or colored foils, thus managing to create full colors such as red and black, but also fashion effects such as shiny and opaque.

Whitek™ is therefore a highly technological fabric, fashion and not only because thanks to a treatment certified Sanytized®, Whitek™ is also antibacterial.
